

Database Design:  
Pushing into online DB

Schema for DB:  
2 tables: one for users, and one for storing routes  
Potentially 1 for leaderboard and 1 more for storing routes for GPS coordinates

How to connect points on a trail @ walking rate?  
Sampling rate for GPS?  
Show Line?

Plans to take it online:  
AWS relational DB or GCP for databases (most likely AWS?)

Upload and push to GitHub
